RE: Pipeline from Lake of the Woods to the Red River of the North

To Whom It May Concern:

The ideas referenced above are out of line and out of someone's fantasy imagination as to a new way to waste and use up the United States of America's Tax Monies!

The Red River Valley of the North is hardly in what is called a Drought Area ! In fact the rain fall and snow fall are more than enough to avoid any drought due to the number of lakes, ditches (not barrow pits as they are called in Colorado), rivers, streams and ponds on the Minnesota side of the Valley!

As a child in the 1940's every home in town had wooden rain barrels to collect rain water which was then used for washing hair and watering plants because it was softer than well water and did not contain the chemicals put in the city water by the Water Department's "do-Gooders"!

The 1930's were a dust bowl in Mid America, I can hardly remember anyone making comments or remembering the Great Drought of the 1930's in the Valley!!!

File that plan in the circular file, Please

Sincerely,
