I read your article in "North Dakota Water". I must be missing something rather obvious. We just recently built a pumping system to draw down something called "Devils Lake". I believe that the discharge goes into the Sheyenne River. This "Devils Lake" has been flooding it's banks for several years. Yes? The Sheyenne River is a tributary of the "Red River of The North". Yes? This "Red River of The North" feeds the Cities of Wahpeton, fargo, grand forks, and numerous other municipalities along it's course. Why Can't This Devils Lake pump system run, and feed this Sheyenne river which in turn empties into the Red River, and supply the poor people of fargo water, so that they can water their lawns, and quit the worrying?? I must be missing the connection. Blaine F. Engelstad, Mandan, ND 663-3654
